
Algorithm 1 A novel primal-dual interior-point relaxation method for problem (1)–(2)

Given $(x_0, \lambda_0, s_0) \in \mathbb{R}^n \times \mathbb{R}^m \times \mathbb{R}^n$, $B_0 \in \mathbb{R}^{n \times n}$, $\mu_0 > 0$, $\rho_0 > 0$, $\eta > 1$, $\gamma_0, \delta, \tau, \sigma \in (0, 1)$.

初始化

Evaluate z_0 and y_0 by (5) and (6), compute $\phi_{(\mu_0, \rho_0)}(x_0, \lambda_0, s_0)$. Given $\epsilon \in (0, \mu_0)$, set $k := 0$.
Set $\ell := 0$, $\mu_{k, \ell} = \mu_k$.

Step 0.1 While $\mu_{k, \ell} > \max\{\eta\phi_{(\mu_{k, \ell}, \rho_k)}(x_k, \lambda_k, s_k), \epsilon\}$, set $\mu_{k, \ell+1} = \mu_{k, \ell}/\eta$;
evaluate z_k and y_k by (5) and (6) with $\mu = \mu_{k, \ell+1}$, compute $\phi_{(\mu_{k, \ell+1}, \rho_k)}(x_k, \lambda_k, s_k)$,
set $\ell = \ell + 1$, end.

Set $\mu_k = \mu_{k, \ell}$, $\gamma = \min\{\gamma_0, \mu_k/\phi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k)\}$.

检验终止条件

While $\mu_k \leq \epsilon$ and $\phi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k) \leq \epsilon$, stop the algorithm.

计算迭代方向

Step 1. Calculate $\Delta\mu_k$ by $\Delta\mu_k = -\mu_k + \gamma\phi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k)$.

Step 2. Solve the linear system (33) to obtain $d_k \equiv (d_{xk}, d_{\lambda k}, d_{sk})$.

Step 3. Select the step-size $\alpha_k \in (0, 1]$ to be the maximal number in $\{1, \delta, \delta^2, \dots\}$ such that the inequality

$$\begin{aligned} \phi_{(\mu_k + \alpha_k \Delta\mu_k, \rho_k)}(x_k + \alpha_k d_{xk}, \lambda_k + \alpha_k d_{\lambda k}, s_k + \alpha_k d_{sk}) \\ \leq (1 - 2\tau\alpha_k)\phi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k) \end{aligned} \quad (34)$$

计算步长

is satisfied.

更新迭代点

Step 4. Set $\mu_{k+1} = \mu_k + \alpha_k \Delta\mu_k$, $x_{k+1} = x_k + \alpha_k d_{xk}$, $s_{k+1} = s_k + \alpha_k d_{sk}$, and $\lambda_{k+1} = \lambda_k + \alpha_k d_{\lambda k}$.

更新控制参数 (ρ)

Step 5. Update ρ_k to $\rho_{k+1} = \max\{\rho_k, \sigma\|s_{k+1}\|_\infty / \max(\|x_{k+1}\|, 1)\}$. Evaluate by (5) and (6)

$$z_{k+1} = z(x_{k+1}, s_{k+1}; \mu_{k+1}, \rho_{k+1}) \text{ and } y_{k+1} = y(x_{k+1}, s_{k+1}; \mu_{k+1}, \rho_{k+1}),$$

值, 据此将 μ
修改至合适
范围)

compute $\phi_{(\mu_{k+1}, \rho_{k+1})}(x_{k+1}, \lambda_{k+1}, s_{k+1})$.

Set $\ell := 0$, $\mu_{k+1, \ell} = \mu_{k+1}$.

Step 5.1 While $\mu_{k+1, \ell} > \max\{\eta\phi_{(\mu_{k+1, \ell}, \rho_{k+1})}(x_{k+1}, \lambda_{k+1}, s_{k+1}), \epsilon\}$, set $\mu_{k+1, \ell+1} = \mu_{k+1, \ell}/\eta$;

evaluate z_{k+1} and y_{k+1} by (5) and (6) with $\mu = \mu_{k+1, \ell+1}$,

compute $\phi_{(\mu_{k+1, \ell+1}, \rho_{k+1})}(x_{k+1}, \lambda_{k+1}, s_{k+1})$, set $\ell = \ell + 1$, end.

Set $\mu_{k+1} = \mu_{k+1, \ell}$, $\gamma = \min\{\gamma_0, \mu_{k+1}/\phi_{(\mu_{k+1}, \rho_{k+1})}(x_{k+1}, \lambda_{k+1}, s_{k+1})\}$.

Step 6. Update B_k to B_{k+1} , set $k := k + 1$.

End (while)

Algorithm 1 Primal-Dual Interior Point Method

Ensure: Optimal solution (x^*, s^*, y^*, z^*)

```
1: Initialization:

初始化

更新控制参数 (μ)

计算迭代方向 (预测步)

计算迭代方向 (矫正步)

计算步长

更新迭代点

需要根据两者的差异，以及 QOCO 的代码实现，制定合适的修改计划

- 需要修改的主要是两个核心的函数：qoco_setup 与 qoco_solve，以及与它们相关的数据结构；这些数据结构的修改又可能影响到 QOCO 代码这两个核心函数调用的许多的子过程的函数
- 可以采取这样的方法：遵循 QOCO 的完整文件树结构，但是一开始只留空白文件，再逐步往里面复制 QOCO 程序中的相关部分。按照自顶向下的编程思路，以 qoco_solve 的改写为核心，逐个重写数据结构，qoco_setup 和其他一系列的子函数，对于 IPRM 中与 QOCO 相同的子函数可以重新使用（尤其是许多关于稀疏矩阵操作的过程可以参考），其余部分需要自己追加。

QOCO 的问题：

$$\begin{aligned} & \underset{x}{\text{minimize}} && \frac{1}{2}x^\top Px + c^\top x \\ & \text{subject to} && Gx \preceq_K h \\ & && Ax = b, \end{aligned}$$

IPRM 的问题：

$$\begin{aligned} & \text{minimize} \quad (\min) && f(x) \\ & \text{subject to} \quad (\text{s.t.}) && h(x) = 0, \quad x \geq 0, \end{aligned}$$

这里还存在一个 gap：IPRM 的不等式约束采用的是简单的 $x \geq 0$ ，但是二次规划问题的一般形式中，不等式约束需要表示为 $Gx \leq h$ ，需要将 IPRM 的方法做一些修改才能适用于一般的二次规划问题。

QOCO 和 IPRM 使用比较不一样的非线性规划/二次规划问题的定义，使得导出的

KKT 系统不一样，选择以 QOCO 的为标准，这样代码可能更容易复用。

使用 QOCO 的记号来推导一下：

$$\begin{aligned} \min_x \quad & f(x) = \frac{1}{2}x^\top Px + c^\top x \\ \text{s.t.} \quad & Gx \leq h \Leftrightarrow \xi = h - Gx \geq 0 \quad (\text{要注意此处的负号，会影响到后面的 KKT 系统}) \\ & Ax = b \Leftrightarrow H(x) = Ax - b = 0 \end{aligned}$$

比较 IPRM 的 (1) (2) 和 (4) 式，替换为一般的约束后，对数障碍子问题(4)为：

$$\begin{aligned} \min_x \quad & f(x) - \mu \sum_{j=1}^n \ln(\xi_j) \\ \text{s.t.} \quad & H(x) = 0 \end{aligned}$$

(5) - (6) 定义式不变（只是替换字母）：

$$\begin{aligned} z_j(\xi_j, s_j; \mu, \rho) &= \frac{1}{2\rho} \left(\sqrt{(s_j - \rho\xi_j)^2 + 4\rho\mu} - (s_j - \rho\xi_j) \right) \\ y_j(\xi_j, s_j; \mu, \rho) &= \frac{1}{2\rho} \left(\sqrt{(s_j - \rho\xi_j)^2 + 4\rho\mu} + (s_j - \rho\xi_j) \right) \end{aligned}$$

(7) - (9) 变为：

$$\begin{aligned} \min_x \quad & f(x) - \mu \sum_{j=1}^n \ln z_j(\xi, s; \mu, \rho) \\ \text{s.t.} \quad & H(x) = 0 \\ & z(\xi, s; \mu, \rho) - \xi = 0 \end{aligned}$$

Lemma2.1 (1) (2) (3) 式都还成立，只是把所有的 x_j 换成 ξ_j 。

Lemma2.2：原文中关于 x 的梯度变为了此处推导中关于 ξ 的梯度，各处的 x 要替换成 ξ 。

Lemma2.3 中，对数障碍子问题的 KKT 系统 (14) - (16) 变为：

$$\begin{aligned}\nabla f(x) - \nabla H(x)\lambda + G^\top s &= 0 \\ H(x) &= 0 \\ \xi_j > 0, s_j > 0, \xi_j s_j &= \mu, j = 1, 2, \dots, n\end{aligned}$$

这里 s 的系数变为 $+G^\top$ ，是因为在拉格朗日函数中它的项是 $-s^\top \xi = -s^\top (h - Gx) = s^\top (Gx - h)$ 。

极小极大子问题 (17) 变为：

$$\begin{aligned}x \in \{x \in \mathcal{R}^n \mid h(x) = 0\} \max_{s_j \in \mathcal{R}} F(x, s; \mu, \rho) \\ F(x, s; \mu, \rho) = f(x) + \sum_{j=1}^n \Gamma(\xi_j, s_j; \mu, \rho) \\ \Gamma(\xi_j, s_j; \mu, \rho) \equiv -\mu \ln z_j(\xi_j, s_j; \mu, \rho) + s_j(z_j(\xi_j, s_j; \mu, \rho) - \xi_j) \\ + \frac{1}{2} \rho |z_j(\xi_j, s_j; \mu, \rho) - \xi_j|^2\end{aligned}$$

Lemma 2.4: 重新算一下中 F 对 x 的梯度（先算关系到 (18) - (20) 的 $\nabla_x F$ ）。

$$\begin{aligned}\frac{\partial \Gamma(\xi_j, s_j; \mu, \rho)}{\partial \xi_j} &= -\rho y_j \\ \frac{\partial \Gamma(\xi_j, s_j; \mu, \rho)}{\partial s_j} &= z_j - \xi_j \\ \xi &= h - Gx \\ \xi_j = h_j - \sum_k G_{jk} x_k &\Rightarrow \frac{\partial \xi_j}{\partial x_k} = -G_{jk} \\ \frac{\partial \sum_j \Gamma(\xi_j, s_j; \mu, \rho)}{\partial x_k} &= \sum_j \frac{\partial \xi_j}{\partial x_k} \frac{\partial \Gamma(\xi_j, s_j; \mu, \rho)}{\partial \xi_j} = \sum_j G_{jk} \rho y_j\end{aligned}$$

可得

$$\nabla_x F(x, s; \mu, \rho) = \nabla_x f(x) + \rho G^\top y$$

Theorem 2.5 (2)

(23) 的 KKT 条件变成：

$$\begin{aligned}\nabla f(x) - \nabla H(x)\lambda + \rho G^T y &= 0 \\ h(x) &= 0 \\ z - \xi &= 0\end{aligned}$$

然后由 Lemma 2.1(1), 第三行为 $z - \xi = y - \frac{s}{\rho} = 0$, 代入第一行得到

新的 (18) - (20) 式, 加上 μ 的方程, 对应于 **(24) - (27) 式**:

$$\begin{aligned}\mu &= 0 \\ \nabla f(x) - \nabla H(x)\lambda + G^T s &= 0 \\ H(x) &= 0 \\ z - \xi &= 0\end{aligned}$$

(28) :

$$\begin{aligned}\phi_{(\mu,\rho)}(x, \lambda, s) &= \frac{1}{2} \|\psi_{(\mu,\rho)}(x, \lambda, s)\|^2 \\ \psi_{(\mu,\rho)}(x, \lambda, s) &= \begin{bmatrix} \nabla f(x) - \nabla H(x)\lambda + G^T s \\ H(x) \\ z - \xi \end{bmatrix}\end{aligned}$$

(29) - (30) :

$$\begin{aligned}\mu + \gamma \phi_{(\mu,\rho)}(x, \lambda, s) &= 0 \\ \psi_{(\mu,\rho)}(x, \lambda, s) &= 0\end{aligned}$$

由 (28) 式求导得 (28D) :

$$\nabla_{(\mu,x,\lambda,s)} \phi_{(\mu_k,\rho_k)}(x_k, \lambda_k, s_k) = \nabla_{(\mu,x,\lambda,s)} \psi_{(\mu_k,\rho_k)}(x_k, \lambda_k, s_k) \psi_{(\mu_k,\rho_k)}(x_k, \lambda_k, s_k)$$

由 (30) 式的牛顿迭代公式得到 **(32) 式**:

$$\nabla_{(\mu,x,\lambda,s)} \psi_{(\mu_k,\rho_k)}(x_k, \lambda_k, s_k)^\top \begin{bmatrix} \Delta\mu \\ d_x \\ d_\lambda \\ d_s \end{bmatrix} = -\psi_{(\mu_k,\rho_k)}(x_k, \lambda_k, s_k)$$

式 (29) 同样由牛顿迭代公式得

$$\left(\gamma \nabla_{(\mu,x,\lambda,s)} \phi_{(\mu_k,\rho_k)}(x_k, \lambda_k, s_k) + \nabla_{(\mu,x,\lambda,s)} \mu|_{\mu=\mu_k, \dots} \right)^\top \begin{bmatrix} \Delta\mu \\ d_x \\ d_\lambda \\ d_s \end{bmatrix} = -\mu_k - \gamma \phi_{(\mu_k,\rho_k)}(x_k, \lambda_k, s_k)$$

左边代入 (28D) 并计算得

$$\left(\gamma \psi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k)^\top \nabla_{(\mu, x, \lambda, s)} \psi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k)^\top + \begin{pmatrix} 1 & 0 \end{pmatrix} \right) \begin{bmatrix} \Delta \mu \\ d_x \\ d_\lambda \\ d_s \end{bmatrix}$$

再由 (30) 式、(28) 式化简得

$$-2\gamma \phi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k) + \Delta \mu$$

与右边比较得 (31) 式:

$$\Delta \mu = -\mu_k + \gamma \phi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k)$$

$\Delta \mu_k$ 可由 (31) 式计算。

考虑 (32) 式左边的系数矩阵:

$$\frac{\partial z_j}{\partial \xi_j} = \frac{z_j}{z_j + y_j}$$

$$\frac{\partial z_j}{\partial x_k} = \frac{\partial \xi_j}{\partial x_k} \frac{\partial z_j}{\partial \xi_j} = -G_{jk} \frac{z_j}{z_j + y_j}$$

可知

$$\begin{aligned} \nabla_x z &= -G^\top (Z + Y)^{-1} Z \\ \nabla_x \xi &= -G^\top \\ \nabla_x (z - \xi) &= -G^\top ((Z + Y)^{-1} Z - I) = G^\top (Z + Y)^{-1} Y \\ \nabla_{(\mu, x, \lambda, s)} \psi_{(\mu_k, \rho_k)}(x_k, \lambda_k, s_k) &= \begin{bmatrix} 0 & 0 & \frac{1}{\rho_k} e^\top (Z_k + Y_k)^{-1} \\ B_k & \nabla H(x_k) & G^\top (Z_k + Y_k)^{-1} Y_k \\ -\nabla H(x_k)^\top & 0 & 0 \\ G & 0 & -\frac{1}{\rho_k} (Z_k + Y_k)^{-1} Z_k \end{bmatrix} \\ \begin{bmatrix} 0 & B_k & -\nabla H(x_k) & G^\top \\ 0 & \nabla H(x_k)^\top & 0 & 0 \\ \frac{1}{\rho_k} (Z_k + Y_k)^{-1} e & (Z_k + Y_k)^{-1} Y_k G & 0 & -\frac{1}{\rho_k} (Z_k + Y_k)^{-1} Z_k \end{bmatrix} \begin{bmatrix} \Delta \mu \\ d_x \\ d_\lambda \\ d_s \end{bmatrix} &= \begin{bmatrix} -r_k^d \\ -r_k^h \\ -r_k^e \end{bmatrix} \end{aligned}$$

最后一列乘以 $-I$:

$$\begin{bmatrix} 0 & B_k & -\nabla H(x_k) & G^\top \\ 0 & \nabla H(x_k)^\top & 0 & 0 \\ -\frac{1}{\rho_k}(Z_k + Y_k)^{-1}e & -(Z_k + Y_k)^{-1}Y_k G & 0 & \frac{1}{\rho_k}(Z_k + Y_k)^{-1}Z_k \end{bmatrix} \begin{bmatrix} \Delta\mu \\ d_x \\ d_\lambda \\ d_s \end{bmatrix} = \begin{bmatrix} -r_k^d \\ -r_k^h \\ r_k^e \end{bmatrix}$$

分离出左边 $\Delta\mu$ 的式子并移到右边：

$$\begin{bmatrix} B_k & -\nabla H(x_k) & G^\top \\ \nabla H(x_k)^\top & 0 & 0 \\ -(Z_k + Y_k)^{-1}Y_k G & 0 & \frac{1}{\rho_k}(Z_k + Y_k)^{-1}Z_k \end{bmatrix} \begin{bmatrix} d_x \\ d_\lambda \\ d_s \end{bmatrix} = \begin{bmatrix} -r_k^d \\ -r_k^h \\ r_k^e + \frac{1}{\rho_k}\Delta\mu(Z_k + Y_k)^{-1}e \end{bmatrix}$$

其中

$$\begin{aligned} r_k^d &= \nabla f(x_k) - \nabla H(x_k)\lambda_k + G^\top s_k \\ r_k^h &= H(x_k) \\ r_k^e &= z_k - \xi_k \end{aligned}$$

B_k 是拉格朗日函数的 Hessian 矩阵。

这与原文的 **(33)** 式对应。

将第三分块行左乘以 $-\rho_k G^\top$ 加到第一分块行：

$$\begin{aligned} &\begin{bmatrix} B_k + \rho_k G^\top (Z_k + Y_k)^{-1}Y_k G & -\nabla H(x_k) & G^\top (Z_k + Y_k)^{-1}Y_k \\ \nabla H(x_k)^\top & 0 & 0 \\ -(Z_k + Y_k)^{-1}Y_k G & 0 & \frac{1}{\rho_k}(Z_k + Y_k)^{-1}Z_k \end{bmatrix} \begin{bmatrix} d_x \\ d_\lambda \\ d_s \end{bmatrix} \\ &= \begin{bmatrix} -r_k^d - \rho_k G^\top r_k^e - G^\top \Delta\mu(Z_k + Y_k)^{-1}e \\ -r_k^h \\ r_k^e + \frac{1}{\rho_k}\Delta\mu(Z_k + Y_k)^{-1}e \end{bmatrix} \end{aligned}$$

对第二、三分块行分别乘以 $-I$ ，再把右边的负号提出来，得 **(33)** 式的对称化系统：

$$\begin{aligned} &\begin{bmatrix} B_k + \rho_k G^\top (Z_k + Y_k)^{-1}Y_k G & -\nabla H(x_k) & G^\top (Z_k + Y_k)^{-1}Y_k \\ -\nabla H(x_k)^\top & 0 & 0 \\ (Z_k + Y_k)^{-1}Y_k G & 0 & -\frac{1}{\rho_k}(Z_k + Y_k)^{-1}Z_k \end{bmatrix} \begin{bmatrix} d_x \\ d_\lambda \\ d_s \end{bmatrix} \\ &= - \begin{bmatrix} \hat{r}_k^d + G^\top \Delta\mu(Z_k + Y_k)^{-1}e \\ -r_k^h \\ r_k^e + \frac{1}{\rho_k}\Delta\mu(Z_k + Y_k)^{-1}e \end{bmatrix} \end{aligned}$$

其中

$$\begin{aligned}\hat{r}_k^d &= r_k^d + \rho_k G^\top r_k^e = \nabla f(x_k) - \nabla H(x_k)\lambda_k + G^\top s_k + \rho_k G^\top (z_k - \xi_k) \\ &= \nabla f(x_k) - \nabla H(x_k)\lambda_k + \rho_k G^\top y_k\end{aligned}$$

代入 $f(x) = \frac{1}{2}x^\top Px + c^\top x$, $H(x) = Ax - b$, $\xi = h - Gx$, 计算系统中具体的量:

$$\begin{aligned}\nabla f(x_k) &= Px_k + c \\ \nabla H(x_k) &= A^\top \\ B_k &= P^\top = P \\ r_k^h &= Ax_k - b \\ r_k^e &= Gx_k + z_k - h \\ r_k^d &= Px_k - A^\top \lambda_k + G^\top s_k + c \\ \hat{r}_k^d &= Px_k - A^\top \lambda_k + \rho_k G^\top y_k + c\end{aligned}$$

验证: 当 $P = O$, $\xi = x$ ($h = 0, G = -I$) 时,

(33) 式变成:

$$\begin{bmatrix} O & -A^\top & -I \\ A & O & O \\ (Z_k + Y_k)^{-1}Y_k & O & \frac{1}{\rho_k}(Z_k + Y_k)^{-1}Z_k \end{bmatrix} \begin{bmatrix} d_x \\ d_\lambda \\ d_s \end{bmatrix} = \begin{bmatrix} -(-A^\top \lambda_k - s_k + c) \\ -(Ax_k - b) \\ (-x_k + z_k) + \frac{1}{\rho_k} \Delta\mu(Z_k + Y_k)^{-1}e \end{bmatrix}$$

与原文 (39) 式的推导一致。

将以上量代入到对称化系统中:

$$\begin{aligned}& \begin{bmatrix} P + \rho_k G^\top (Z_k + Y_k)^{-1}Y_k G & -A^\top & G^\top (Z_k + Y_k)^{-1}Y_k \\ -A & O & O \\ (Z_k + Y_k)^{-1}Y_k G & O & -\frac{1}{\rho_k}(Z_k + Y_k)^{-1}Z_k \end{bmatrix} \begin{bmatrix} d_x \\ d_\lambda \\ d_s \end{bmatrix} \\ &= - \begin{bmatrix} Px_k - A^\top \lambda_k + \rho_k G^\top y_k + c + G^\top \Delta\mu(Z_k + Y_k)^{-1}e \\ -Ax_k + b \\ Gx_k + z_k - h + \frac{1}{\rho_k} \Delta\mu(Z_k + Y_k)^{-1}e \end{bmatrix}\end{aligned}$$

左边系数矩阵记为 K , 右边记为 r

静态正则化:

$$\hat{K} = K + \begin{bmatrix} \epsilon_s I & & \\ & -\epsilon_s I & \\ & & -\epsilon_s I \end{bmatrix}$$

$$\begin{bmatrix} P + \epsilon_s I + \rho_k G^\top (Z_k + Y_k)^{-1} Y_k G & -A^\top & G^\top (Z_k + Y_k)^{-1} Y_k \\ -A & -\epsilon_s I & O \\ (Z_k + Y_k)^{-1} Y_k G & O & -\epsilon_s I - \frac{1}{\rho_k} (Z_k + Y_k)^{-1} Z_k \end{bmatrix}$$

动态正则化: $\Pi K \Pi^\top = L D L^\top$, 根据 QOCO Algorithm 2 调整 D :

Algorithm 2 Dynamic Regularization

```

1: Given:  $\epsilon_d > 0$ 
2: if  $D_{ii}$  should be positive then
3:   if  $D_{ii} < 0$  then
4:      $D_{ii} = \epsilon_d$ 
5:   else
6:      $D_{ii} = D_{ii} + \epsilon_d$ 
7:   end if
8: else if  $D_{ii}$  should be negative then
9:   if  $D_{ii} > 0$  then
10:     $D_{ii} = -\epsilon_d$ 
11:   else
12:     $D_{ii} = D_{ii} - \epsilon_d$ 
13:   end if
14: end if

```

分析稀疏结构:

只考虑 $\hat{K}$ 的上三角部分。

(1,2)块为 $-A^\top$, 具有静态的稀疏结构

(1,3)块为 $G^\top (Z_k + Y_k)^{-1} Y_k$, 动态, 但是与 $G^\top$ 的稀疏结构一致 (每列乘上特定的因子, 不改变非零元素分布)

(2,2)块为 $-\epsilon_s I$, 非零元素分布在对角线上

(2,3)块为 O

(3,3)块为 $-\epsilon_s I - \frac{1}{\rho_k} (Z_k + Y_k)^{-1} Z_k$, 非零元素分布在对角线上

(1,1)块为 $P + \epsilon_s I + \rho_k G^\top (Z_k + Y_k)^{-1} Y_k G$ 。静态部分 $P + \epsilon_s I$ 有确定的稀疏结构

记 $T = \rho_k (Z_k + Y_k)^{-1} Y_k$, 动态部分的元素:

$$(G^\top T G)_{ij} = \sum_l G_{il}^\top T_{ll} G_{lj} = \sum_l T_{ll} G_{li} G_{lj}$$

T_{ll} 是动态变化的, 只有对所有 l , $G_{li} G_{lj} = 0$ (第 i, j 两列元素的关系) 时 $(G^\top T G)_{ij} = 0$ 才一定成立

据此可得动态部分 $G^{\top}TG$ 的稀疏结构。

对静态和动态部分的非零元素位置集合取并集即为(1,1)块的稀疏结构。
